## 微算機原理與實習 7-SEG印出學號末四碼

班級:資工二A

學號:4070E021

姓名:蘇宇祥

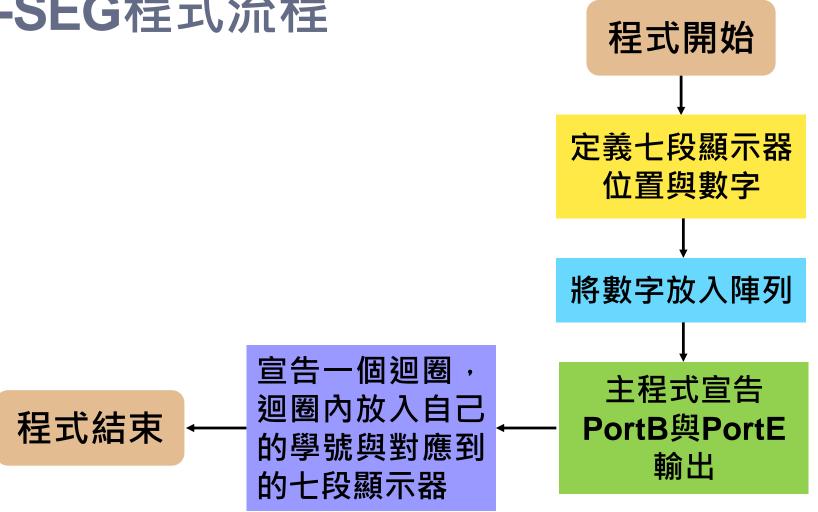

指導老師:周志學

#### **Outline**

- 一、程式流程
- 二、程式碼解說
- 三、顯示結果

# 一、程式流程

#### 7-SEG程式流程

# 二、程式解說

### 1.定義七段顯示器(1-8)位置

```
1 #include "WT59F064.h"
2 #define Digit_1 0x6000
3 #define Digit_2 0x4000
4 #define Digit_3 0x2000
5 #define Digit_4 0x0000
6 #define Digit_5 0xE000
7 #define Digit_6 0xC000
8 #define Digit_7 0xA000
9 #define Digit_8 0x8000
```

#### 2.定義數字編碼

```
11 #define Number 0
                     0x3F3F
12 #define Number 1
                     0x0606
13 #define Number 2
                     0x5B5B
14 #define Number 3 0x4F4F
15 #define Number 4
                     0x6666
16 #define Number_5 0x6D6D
17 #define Number 6 0x7D7D
18 #define Number 7
                     0x2727
19 #define Number_8
                     0x7F7F
20 #define Number_9 0x6767
21 #define Number_E
                     0x7979
22 #define Number_Dot
                     0x8080
```

#### 3.將數字放入陣列

```
27 void delay1(unsigned int nCount)
28 {
29    unsigned int i;
30    for(i=0;i<nCount;i++);
31 }</pre>
```

## 4.在主程式宣告七段顯示器 PortB與PortE

```
32 int main()
33 {
      outw(GPIO_B_BASE+GPIO_ACT_OFFSET, 0xFFFF); //Initialize GPIO_B PortB acts as GPIO
34
      //GPIO ACT PB = 0xFFFF;
35
36
      outw(GPIO B BASE+GPIO OMOD OFFSET, 0x0);//PUSH/PULL output mode
37
      //GPIO OMOD PB = 0x0;
38
      outw(GPIO B BASE+GPIO OEN OFFSET, 0x0);//Be set as output mode
39
      //GPIO OEN PB = 0x0;
      outw(GPIO E BASE+GPIO ACT OFFSET, 0xFFFF);//Be set as GPIO mode, PEO~PE7 = 7SEG 0 a, d,c,...,dp
40
      //GPIO ACT PE = 0xFFFF; //Initialize GPIO E
41
      outw(+GPIO E BASE+GPIO OMOD OFFSET, 0x0);
42
      //GPIO OMOD PE = 0x0;
43
44
      outw(GPIO E BASE+GPIO OEN OFFSET, 0x0);
      //GPIO OEN PE = 0x0;
45
      //outw(GPIO E BASE+GPIO DATAOUT OFFSET, 0xFFFF);
46
      //GPIO DAT PE = 0xFFFF; //Light all seg. and dp
47
      //delay1(1000000);
48
```

### 5.在while迴圈內輸入自己的學號編碼 與其對應到的七段顯示器

```
while(1)
50
51
52
          unsigned int i;
          for (i=0; i<2; i++)
53
54
55
          outw(GPIO E BASE+GPIO DATAOUT OFFSET, 0x79); //E
          outw(GPIO B BASE+GPIO DATAOUT OFFSET, Digit 4); //Display the RDIG-4
56
          //GPIO DAT PB = Digit 4;
57
58
          delay1(500);
          outw(GPIO E BASE+GPIO DATAOUT OFFSET, 0x3f); //0
59
          outw(+GPIO B BASE+GPIO DATAOUT OFFSET, Digit 3);//Display the RDIG-3
60
61
          //GPIO DAT PB = Digit 3;
62
          delav1(500);
63
          outw(GPIO E BASE+GPIO DATAOUT OFFSET, 0x5b);
                                                          //2
          outw(+GPIO B BASE+GPIO DATAOUT OFFSET, Digit 2);//Display the RDIG-2
64
65
          //GPIO DAT PB = Digit 2;
          delay1(500);
66
          outw(GPIO E BASE+GPIO DATAOUT OFFSET, 0x06); //1
67
          outw(+GPIO B BASE+GPIO DATAOUT OFFSET, Digit 1);//Display the RDIG-1
68
69
          //GPIO DAT PB = Digit 1;
          delay1(500);
70
71
72
```

## 三、顯示結果
